Subject: Chip Category Review: Customer Segments & Trial Store Results

Hi Julia,

Attached is our completed analysis of the chips category, covering both customer purchasing behaviour and the recent store trial (stores 77, 86 and 88).

In short: we'd recommend rolling out the trial initiative more broadly. All three trial stores saw statistically significant sales increases during the trial period (up to +62%), and in each case the growth came mainly from attracting more customers rather than existing customers spending more per visit.

On the customer side, we found a clear split worth building strategy around:

- Older and Young Families spend the most per customer (~\$32-\$35) and are worth prioritising for retention and loyalty offers.
- Young Singles/Couples are your largest customer base by far, but spend the least per visit - a strong opportunity to grow basket size through targeted offers.

The attached deck walks through the full findings, the control-store methodology, and three recommended next steps for the coming strategic period. One note: Store 88's matched control was a weaker fit than the other two, so we'd treat that result with slightly more caution until validated further.

Happy to walk through any of this together before it goes into the broader report - let me know a time that works.

Best,

Lavanya Shanmugaraj
